Families as Lifelong Educators

The National Center on Parent, Family, and Community Engagement has created a Research to Practice Series on the Family Engagement Outcomes of the Office of Head Start (OHS) Parent, Family, and Community Engagement (PFCE) Framework. One in the series, this resource addresses the “Families as Lifelong Educators” Outcome: “Parents and families observe, guide, promote, and participate in the everyday learning of their children at home, school, and in their communities.”

Aligned with HS Performance Standards, this resource presents a selected summary of research, proven interventions, and program strategies intended to be useful for the Head Start (HS) and Early Head Start (EHS) community.

Introduction

Parents and families are their children’s most important educators, with many opportunities to build the foundation for a lifetime of learning. Families educate their children every day – both in formal and informal ways. Through positive interactions with their children, parents promote healthy development and prepare them for school, successful relationships, rewarding work, and better health. The skills and attitudes parents encourage will teach their children to care for themselves and for others, so they will grow into adults who can do the same.

Through learning activities with their parents, children help develop social competence, motivation, persistence, and an overall love of learning (Dunst, Bruder, Trivette, & Hamby, 2006; McWayne, Hampton, Fantuzzo, Cohen, & Sekino, 2004). These are all key components to success in school. Parents can encourage positive attitudes toward school by telling stories, reading, singing songs, and talking together about topics that children will learn about in school (McWayne et al., 2004). Parents give children opportunities for exploration and self-discovery (Rogoff, 1990) and prepare them to learn the language and math skills they will need to find good jobs later on.

While all families want to give their children the best chance at success, they may see their roles as lifelong educators in different ways. They make choices that reflect their cultures, values, and priorities. For example, some families might want their children to speak multiple languages. They may want to preserve a home language and support dual language learning at school. Partnering with families can...
Families as Lifelong Educators: What We Know

Early Experiences Provide the Foundation for Lifelong Learning

Parents can begin to promote children’s lifelong learning as early as pregnancy. By providing a safe, nourishing, toxin-free environment, expectant parents foster healthy brain development (McEwen, 2003). Then, beginning in infancy, children learn from repeated experiences with others, especially parents and other caregivers who interact with them often.

Through these experiences, infants and children develop expectations of others, and themselves, including expectations for success or failure in learning. The quality of these parent-child interactions impacts:

- language and cognitive development,
- academic success (Bowlby, 1969; Denham, Mitchell-Copeland, Strandberg, Auerbach, & Blair, 1997; Fearon et al., 2010),
- social and emotional competence (the ability to get along with others, and to understand and cope with emotions),
- levels of anxiety and aggression,
- feelings of self-worth, and
- how children interpret their broader social world.

In these interactions, the ability to understand and respond to their children’s cues – parental sensitivity – (Thompson, 2008) influences children’s emotional development (Thompson & Meyer, 2007). From birth on, children use facial expressions, body movements and posture, coos, and cries. Later they use words to let parents know what they need – to be held and comforted, to be played with and stimulated, to sleep or to nurse. They also communicate when they feel fatigue, hunger, pain, frustration, boredom, pleasure, and affection.

Parental sensitivity is key to a parent’s role as their child’s first educator (Bowlby, 1969, 1988). Cues such as quiet, focused attention, or fidgeting and restlessness can tell parents when their children are ready to learn and when they are not. These cues can tell parents their children need a break or just a little encouragement in order to stay excited about learning. Program staff and parents can work together to understand and respond to children’s cues effectively.

Bridging Home and School with Family Partnerships

Parents who have positive relationships with their children’s teachers, and spend time in their children’s childcare, preschool, or school environment, advance their children’s school success in many ways. Their involvement improves academic outcomes, for example, by increasing children’s rates of retention in classrooms, cutting time spent in special education classrooms, and boosting graduation rates (McWayne et al., 2004). The children of involved parents are also less likely to be anxious, depressed, defiant, and aggressive (Yeboah, 2002). Children are more likely to succeed when parents advocate for their needs (Trumbull, Rothstein-Fisch, Greenfield, & Quiroz, 2001) such as special education services, or support for both the child’s home language and English language skills. Parents can advocate effectively for their children’s needs when they know their rights and have access to legal and other community resources.
For example, in collaborating with schools to develop individualized educational plans (IEPs), program staff can partner with parents to ensure that the final IEP:

- incorporates parents’ observations, concerns, and knowledge about their child,
- specifies the supports and interventions the child needs – in language that parents understand and agree with, and
- addresses objections parents raise during the planning process.

Parents are better able to help their child learn when they understand their child’s individual temperament and how their child learns at each developmental stage. Parents and program staff can arrive at common understandings of a child’s unique learning style by sharing observations and information with one another. They can learn together about how to respond to the child’s temperament and share their views on appropriate expectations for that child.

Parent-teacher and parent-home visitor discussions of child assessment data can also help inspire and guide learning activities at home and at the HS/EHS program. This can increase consistency across these settings and reinforce children’s learning. Teachers and home visitors can share a child’s portfolio with parents, and listen to comments and insights on their child’s work. This shows respect for parents’ views and allows teachers and home visitors to adjust and balance their comments about the child’s strengths and challenges.

Classroom efforts to improve children’s outcomes can be enhanced by partnering with families. Teachers can choose classroom activities that parents can easily do at home, such as dialogic reading (specific back and forth exchanges between adult and child while reading) (Institute of Educational Sciences [IES], 2007) or rhythmic moving games that involve counting.

Programs can encourage parents to bring learning activities such as songs and stories to the classroom that come from their own childhoods and cultures. This creates a bridge between home and school, and a parent-teacher partnership that promotes children’s language and math skills.

Interventions for Supporting Families as Lifelong Educators

The following approaches are not the only useful, evidence-based interventions in the field but represent some good examples of options for programs to consider. Some interventions focus on one aspect of a family’s life, or a specific time period, such as the prenatal period. Other interventions may address a range of topics within the context of a group or educational setting. Approaches can be comprehensive and/or multi-level. Comprehensive services are a complete set of services to address the full range of a family’s challenges. Multi-level approaches address challenges within the family and in the various contexts and environments that affect them.

Prenatal Interventions

Many effective and promising prenatal interventions provide supportive relationships, connect parents to each other, and empower parents to take charge of their own health during this vulnerable period. These include doula programs (peers trained to accompany women through pregnancy and the postpartum period), prenatal massage (for example see http://www6.miami.edu/touch-research), and groups that focus on the prenatal period and preparations for parenthood. Mothers and fathers can both benefit from interventions in the prenatal period. It is a time to begin seeing themselves as parents, and to build and strengthen a social network that will support them in their new roles.
One example is *Centering Pregnancy*, an intervention that promotes self-care, child development knowledge, and connections to other parents in a group setting for expectant mothers (Rising, Kennedy, & Klima, 2004). Positive results include greater maternal knowledge of child development, more prenatal visits, reduced preterm births, and improved birth weights. All of these are associated with better child outcomes.

**Parent Education Interventions**

Simply providing parents with information is unlikely to change behavior. But respectfully engaging parents as equal partners, and welcoming their knowledge, pride, and concerns about their children may lead to greater openness to information - for example, how to boost children’s social and emotional development, and language and math skills. Such information can also include the many evidence-informed and culturally relevant resources that teachers and parents can use as they talk, sing, read, play, and count with children (Bardige, 2009). Conversations in parent groups about all of the children’s progress can also reveal new ways that parents can be most effective as their children’s teachers. Starting with the positive, and listening carefully to parents’ observations first, can help put parents at ease and build trust. The success of parent groups depends on positive relationships with practitioners and/or parent educators (Pinquart & Teubert, 2010).

Parent education classes and support groups can:

- guide parents toward developmentally appropriate expectations for their children, and skills and supports to increase positive parenting behaviors (Horwitz, Chamberlain, Landsverk, & Mullican, 2010),
- increase fathers’ involvement, and decrease parental stress (McIntyre & Abbeduto, 2008), and
- provide opportunities to develop advocacy and leadership skills.

**Parents as Teachers (PAT)** is an example of a parent education intervention that aims to promote parental knowledge of child development, positive parent-child relationships, and parents’ sense of competence in parenting (parenting self-efficacy). Children of families in this program scored higher on standardized measures of intelligence and social development than children in comparison groups (Pfannenstiel, Lambson, & Yarnell, 1996).

Parent education interventions provide social supports including positive connections to other parents. This can reduce the negative mental health impacts of living in poverty (Simpson & Rholes, 2008) that can interfere with parents’ roles as teachers. Informal social support can come from other parents, a partner, and neighbors, and can help create a sense of belonging to a community. This has a strong positive influence on parents’ sense of confidence, perception of child’s temperament and development, as well as overall parenting satisfaction (Raikes & Thompson, 2005).

**Comprehensive and Multi-Level Interventions**

Comprehensive and multi-level services for families are especially important for families living in poverty. The many stressors that are linked to poverty can affect family functioning and children’s development. Lack of resources (such as high quality child care or safe neighborhoods), and greater stress and instability add to the risk of negative child health and behavioral outcomes (Duncan & Brooks-Gunn, 2000). Social, emotional, language, and cognitive development are also at risk (Shonkoff & Phillips, 2000).

HS/EHS programs provide a comprehensive range of services to address poverty’s many challenges and build on the resilience that often accompanies it. Programs such as HS/EHS address the full range of children’s and families’ needs. Analyses of the long-term economic and social impact of such early, comprehensive interventions show that the costs pay off in the long run (Doyle et al., 2009). Comprehensive approaches prevent the negative effects of poverty from spilling over from one generation to the next.

Comprehensive services can help parents advance their children’s language and academic achievement, as well as their social and emotional development. These include:

- medical, social, and financial stability services for parents and children, aimed at improving children’s educational outcomes,
- direct enhancement of parent-child interactions in which children learn with their parents (Ayoub et al., 2009; Bradley, Chazan-Cohen, & Raikes, 2009), and
- support for parent literacy and educational goals that in turn can improve children’s language development (Hoff, 2006; Pan, Rowe, Singer & Snow, 2005).
Partnering with parents to address their full range of needs and build on strengths can also help boost sensitive and stimulating parenting behaviors (Hess, Teti, & Hussey-Gardner, 2004).

Another example that is both multi-level and comprehensive is the Chicago Child-Parent Centers (CPCs) program. The CPC program promotes parents as partners in their children’s education and provides high-quality educational and social support services to children and families from preschool through elementary school. This model improves children’s academic achievement through not only high quality preschool programming, but also increased family involvement (Reynolds, Temple, Roberston, & Mann, 2002).

Conclusion: Bringing It All Together

As children’s lifelong educators, families help their children succeed in school and across the life span. Children’s learning starts with strong positive parent-child relationships and is rooted in warm and sensitive interactions with their caregivers. Programs can encourage parental sensitivity to children’s cues as early as infancy, and support a parent’s sense of competence. This can enhance parents’ ability to watch for and sustain their children’s moment-to-moment readiness for learning. When their children’s cues say “I’m ready to learn,” parents can extend the curriculum beyond the classroom by engaging in learning activities that include warm interactions while reading, rich conversations, singing, dancing, counting, and playing.

HS/EHS programs can create opportunities for families to connect with social supports that strengthen and support their role as lifelong educators. Parents’ skills and confidence can be enhanced and reinforced by supportive relationships with peers, and connections to community programs and a full range of comprehensive services. When families are empowered in the role as their children’s most important teachers, they are more likely to stay engaged with programs, show leadership in schools, and advocate for their children’s success – in learning and in life.

What Can Programs Do?

**Tackle Multiple Stressors with Comprehensive Services:** Programs can connect parents with a full range of coordinated services that build on their strengths and protect their role as their child’s most important teacher. For example, services that help parents to advance their education goals, address their health and mental health needs, stabilize their finances and housing, and connect them with peers and informal social supports all give parents a better chance to be their child’s lifelong educator.

**Partner with Parents to Learn What is Working and What Isn’t:** To use limited resources effectively, engage families in continuous learning and program change. Programs need to know what is working for children and families so that they can expand what works and modify what doesn’t. For example, children’s learning is affected by parents’ interactions with program staff and other parents, so it is important for programs to know how these interactions are working. Programs can ask parents for feedback in surveys or focus groups about their interactions with staff and peers, and use this data to inform professional development and parent activity programming.

**Engage Parents to Build Consistency between Home and School:** Home-school consistency means that parents and programs work together to reinforce children’s learning everywhere that children learn. Leadership and program staff can create consistency between HS/EHS programs and home by establishing respectful dialogue with parents. They can invite parents to come together to give input into the educational process (Quiroz, Greenfield, & Altchech, 1999). Home-school consistency depends on the support of Program Leadership, and corresponding changes in Professional Development, Teaching and Learning, and in the Program Environment.

**Provide Opportunities for Cross-Cultural Learning and Open Communication:** Families’ role as lifelong educators is especially important as children learn about who they are and where they come from. Programs can celebrate families’ unique cultures through classroom activities and curriculum, and community events. Staff and families can work together to support dual language learning, which promotes children’s brain development and success in school. Programs can keep lines of communication open by ensuring that the Program Environment is welcoming and inclusive of families from all backgrounds.
